

Electricity Cheat Sheet

Simple rules to judge plugs, sockets, and appliance load.

W = load • A = capacity • V = voltage

India mains is usually 230V AC.

Remember

- **Watts (W)** = how much power a device uses.
- **Amps (A)** = how much current a socket/strip can carry safely.
- **Volts (V)** = wall supply voltage; in India, usually **230V**.
- **KVA** = your utility connection capacity, not the same as watts.
- **ISEER** = AC efficiency score; higher is better.

Quick formulas

- **Watts = Volts × Amps**
- **Amps = Watts ÷ Volts**
- **At 230V:** 6A ≈ 1380W, 10A ≈ 2300W, 16A ≈ 3680W

Socket rule

6A

Small stuff: chargers, monitor, TV, router

16A

Heavy stuff: AC, geyser, iron, heater, microwave

Your case

- **Contractual load:** 1.64 KVA = 1640 VA ≈ 7A at 230V
- **One Panasonic AC:** about 4–6A in real use
- **Three ACs:** roughly 12–18A total
- **Verdict:** 1.64 KVA is not enough for 3 ACs

Easy memory trick

- **W** = what it consumes
- **A** = what the socket can handle
- **V** = usually fixed by country
- Compare total watts to socket limit
